Von Frey Test TCP_VFR_001

Purpose

To detect mechanical/tactile sensitivity in the mouse paw

Experimental Design

Minimum number of mutant animals: 7 males + 7 females

Age at test: 16 weeks

Sexual dimorphism:

Procedure

- 1. Baseline measurement
 - 1. Move the mice to the testing chambers and leave to acclimate for the specified length of time.
 - 2. Mice should be tested using the simplified up-down method (SUDO) of Bonin et al. (2014).
 - 3. When the mouse is still, apply the filament to the centre of the right hindpaw. Press the filament against the paw for 3 seconds.
 - 4. Mark the response '0' if the mouse does not react, or 'X' if it does react to the filament.
 - 5. Leave the mouse for a minimum of 2 minutes before presentation of the next filament.
 - 6. The next filament to be tested will depend on the response to the previous filament.
 - If the mice did respond to the previous filament, they should be tested with the filament of the next smallest size. Once tested, record the response.
 - If the mice did not respond to the previous filament, they should be tested with the filament of the next largest size. Once tested, record the response.
 - 8. Continue testing the mice until 5 trials have been completed.
 - 9. The procedure is then repeated for a second run.
- 3. Challenge
 - 1. The challenge is administered after the baseline measurement has been completed.
- 5. Test 1
 - 1. 22 hours after the challenge injection, re-test the mouse with the von Frey filaments using the same procedure as described for the baseline measurement.
- 7. Test 2
 - 1. 142 hours after the challenge injection, re-test the mouse with the von Frey filaments using the same procedure as described for the baseline measurement.

Notes

This procedure is a pilot study from the Pain Phenotyping Pilot

A simplified up-down method (SUDO) for measuring mechanical nociception in rodents using von Frey filaments. Bonin RP, Bories C, De Koninck Y. Mol Pain. 2014 Apr 16;10:26. doi: 10.1186/1744-8069-10-26.PMID:24739328
