

Histopathology IMPC_HIS_003

Purpose

To perform histopathological examination and annotation of the IMPC's standard list of organs (see IMPReSS Gross Pathology & Tissue Collection) on stained tissue sections oriented on glass slides (see IMPReSS Tissue Embedding & Block Banking).

Experimental Design

- **Minimum number of animals** : 2M + 2F
- **Age at test:** Week 16

Notes

Significance Score

Not significant

. Interpreted by the histopathologist to be a finding attributable to background strain (e.g. low-incidence hydrocephalus, microphthalmia) or incidental to mutant phenotype (e.g. hair-induced glossitis, focal hyperplasia, mild mononuclear cell infiltrate).

OR

Significant

. Interpreted by the histopathologist as a finding not attributable to background strain and not incidental to mutant phenotype.

Severity Score

Score	Term	Definition
0	Normal	No lesion(s) or abnormalities detectable considering the age and sex of the animal
1	Mild	Abnormality visible, involving single or multiple tissue types in a minimal proportion of an organ, likely to have no functional consequence
2	Moderate	Abnormality visible, involving multiple tissue types in a minority proportion of an organ, likely to have no clinical consequence (subclinical)

3	Marked	Abnormality clearly visible, involving multiple tissue types in a majority proportion of an organ, likely to have minor clinical manifestation(s)
4	Severe	Abnormality clearly visible, involving multiple tissue types in almost all visible area of an organ, likely to have major clinical manifestation(s)
